

## Pressurized Refiner

## Model No. 2503

Since there is a keen demand for resource saving and no pollution in the world, a remarkable advance has been made recently in mechanical pulp, especially TMP (thermomechanical pulp). Much information on TMP is provided globally in the field of research and development. It is undeniable that TMP is more excellent than stone groundwood pulp (GP). So, TMP plants have been constructed and operated in many paper mills in the world. To satisfy the requirement of the pulp and paper industry, we Kumagai Riki developed in 1975 this refiner in collaboration with Japan Pulp and paper Research Institute, Inc. which has advanced pulp preparation technology, based on the conventional KRK normal pressure refiner. Set in the laboratory the same conditions as those in the practical plant operation, and steam chips for a short time, and perform pressurized refining. It features ease of operation and excellent reproducibility.

## **Refiner section** 1.

**Refiner Type:** Motor: **Grinding Plate Size: Rotation Speed of Plate:** Adjustment of Plate Parallelism: Adjustment of Plate Interstice: Section in Contact with Liquid: **Transmission:** 

Material heating section 2.

**Tank Capacity:** Feeder: Feeder Motor:

Section in Contact with Liquid:

3. Grindness adjusting section

Pump: **Discharge Rate:** Pump Discharge Pressure: **Pump Motor: Dilution Water Heating: Power Source: Cooling Water: Outer Dimensions: Instrument Weight:** 

single disc, batch operation three-phase 200/220VAC 45kW 50/60Hz 305mm 3000rpm 3-point support with screw, increment of scale 0.01 mm SUS-316, SCS-14 belt drive

6 liters (1 kg O.D.) option 10 liters screw type three-phase 200/220VAC 0.2kW or 0.4kW SUS-316, SCS-14

constant-feed plunger type 0 to 2 liters/min., steplessly variable speed max. 10kg/cm2 three-phase 200/220VAC 0.4kW or 0.75kW steam heat exchanger three-phase 200/220VAC 50/60Hz 160A water supply 2920 x 1200 x 2580m m 1800 kg
